K3VLS Series Inquiry Form
Applications / Product Usage

The following must be taken into consideration before use.

1. The operating condition of the products shown in this catalog varies depending upon each application. Therefore, the product suitability must be judged by the designer of the hydraulic system and/or the person who finalizes the technical specifications of the machine after analysis and testing. The product specification shall be determined based on the latest catalog and technical documents. The system must be designed taking into account the possibility of machine failure to ensure that all safety, warning, and application requirements are met.

2. For the proper use of the products, descriptions given in the SAFETY PRECAUTIONS must be observed.

3. The technical information in this catalog represents typical characteristics and performance of the products as of the published date.

4. If the intended use of the products is included in the following, please consult with Kawasaki in advance.
   (1) Use the product in the operating conditions or environments other than those described in the technical documents.
   (2) Use the product in the nuclear sector, aviation sector, medical sector, and/or food sector.
   (3) Use the product in applications which may cause substantial harm to others and their property, and especially in applications where ensuring safety is a requirement.

5. The information described in this catalog is subject to change without notice. For the latest information, please contact Kawasaki.
Safety Precautions

Before using the product, you MUST read this catalog and MUST fully understand how to use the product. To use the product safely, you MUST carefully read all Warnings and Cautions in this catalog.

1. Cautions related to operation

- Use the personal protective equipment to prevent injury when the product is in operation.
- Some components are heavy. Handle the product carefully not to hurt your hands and lower back.
- Do not step on, hit or drop, or apply strong force to the product, as these actions may cause operation failure, product damage, or oil leakage.
- Wipe off any oil on the product or the floor completely, as oil can create slippery conditions that may cause drop of the product and personal injury.

2. Warnings and cautions related to installation and removal of the product

- Installation, removal, piping, and wiring must be done by a qualified technician.
- Make sure that the hydraulic power unit is turned off and that the electric motor or engine has completely stopped before starting installation or removal. You must also check that the system pressure has dropped to zero.
- Make sure that the power source is turned off before installing electric components to reduce the risk of electric shock.
- Clean the threads and the mounting surface to prevent damage or oil leakage. Inadequate cleaning may cause insufficient torque and broken seals.
- Use the designated bolts and fasten them with prescribed torque when installing the product. Use of undesigned bolts, and excessive or insufficient tightening torque may induce operation failure, damage, or oil leakage.

3. Warnings and cautions for operation

- Always equip the product with explosion or ignition protection if it is used in potentially explosive or combustible atmospheres.
- Shield rotary parts, such as the motor and pump shaft, to avoid injury.
- Stop operation immediately, and take proper measures when the abnormality such as unusual noise, oil leakage, and smoke is found. Continuing operation under such condition may bring about damage, a fire hazard, or injury.
- Make sure that all pipes, hoses, and connecting points with pipes or hoses, are correctly connected and tightened before starting operation.
- Use the product under the operating conditions and limitations described in the catalog, drawings, and specification sheets.
- Do not touch the product in operation. to reduce the risk of skin burn.
- Use the proper hydraulic oil and maintain the filtration at the recommended level to prevent premature wear and damage.

4. Cautions related to maintenance

- Never modify the product without approval from Kawasaki.
- Disassembly of the product may void the warranty.
- Keep the product clean and dry when storing or transporting.
- The seals may need to be replaced if the product has been stored for an extended period of time.
- Making adjustments of this product will result in the warranty being null and void.
Handling Precautions

1. Operating Fluid and Temperature Range

1) Operating fluid
Values shown in this catalog are based upon using mineral oil based anti-wear hydraulic fluid. To ensure optimal performance use of mineral oil based anti-wear hydraulic fluid is recommended.

2) Viscosity and temperature range
To minimize both oil and seal deterioration, a maximum operating temperature of 60ºC should be considered. Please note that the regulator may become slow to respond when operating at low temperatures (below 20ºC) in extreme cold environments. At such low temperature it is strongly suggested that a warm up cycle is introduced until an operating temperature of 20ºC is achieved.

<table>
<thead>
<tr>
<th>Normal operating range</th>
<th>Allowable range</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Viscosity [mm²/s(cSt)]</strong></td>
<td>10 to 200</td>
</tr>
<tr>
<td><strong>Fluid temperature [°C (°F)]</strong></td>
<td>−20 to +95 (−4 to +203)</td>
</tr>
</tbody>
</table>

2. Filtration and Contamination Control

1) Filtration of working oil
The most important means to prevent premature damage to the pump and associated equipment and to extend its working life, is to ensure that hydraulic fluid contamination control of the system is working effectively.

This begins by ensuring that at the time of installation that all piping, tanks etc. are rigorously cleaned in a sanitary way. Flushing should be provided using an off line filtration system and after flushing the filter elements should be replaced.

A full flow return line filter of 10 micron nominal should be utilised to prevent contaminant ingress from the external environment, a 5 to 10 micron filter with the tank’s breather is also recommended.

2) Suggested acceptable contamination level
The relationship between contamination level and pump life is very difficult to predict as it depends on the type and nature of the contaminant present in the system. Sand or Silica in particular, due to its abrasive nature, does significantly reduce the expected life of a pump. Based on the precondition that there is no significant presence of Silica type substances then a minimum Cleanliness level of -/-18/15 ISO 4406 or SAE AS 4059E Table 1 Class 9 (NAS 1638 Class 9).
3. Drive Shaft Coupling

Alignment between the prime mover and the pump shaft should be within 0.05 mm TIR*. In case the pump is directly coupled to the engine flywheel, use a flexible coupling.

*TIR = Total Indicator Reading

4. Oil Filling and Air Bleeding

1) Pump case filling

Be sure to fill the pump casing with oil through the drain port, filling only the suction line with oil is totally insufficient. The pump contains bearings and high-speed sliding parts including pistons with shoes and a spherical bush that need to be continuously lubricated. Part seizure or total premature failure will occur very quickly if this procedure is not rigidly followed.

2) Air bleeding

Run the pump unloaded for a period to ensure that all residual air within the system is released.

3) Long term out of usage

It is undesirable to leave the pump out of use for a long period e.g. a year or more. In such a situation it is recommended that the pump is run for a short period on a more frequent basis even if it is just unloaded. With regard to a pump held in storage then rotating the shaft on a frequent basis is sufficient. If the pump is left out for more than the suggested time it will require a service inspection.
5. Drain Piping

1) Installation of drain line

It is the preferred option to mount the pump with the case drain piping initially rising above the pump before continuing to the tank. Do not connect the drain line to the inlet line.

Cautions

A) Inlet and drain pipes must be immersed by 200 mm minimum from the lowest level under operating conditions.

B) Height from the oil level to the centre of the shaft must be within 1 meter maximum.

C) The oil in the pump case must be refilled when the pump has not been operated for one month or longer.

The uppermost drain port should be used and the drain piping must be larger in size than the drain port to minimise pressure in the pump case. The pump case pressure must not exceed 0.1 MPa as shown in the illustration below. (Peak pressure must never exceed 0.4 MPa.)

2) Size of drain hose or drain pipe

The internal bore size of the drain hose or drain pipe must be larger than that of the drain port. Arrange the drain line as short as possible.
6. Mounting the Pump Above the Tank

Suction line

7. Shaft Loading and Bearing Life

Although K3VLS pumps are equipped with bearings that can accept some external thrust and radial forces, application of such loads will affect bearing life. Depending on the load magnitude, the load position, and the load orientation, bearing life may be significantly reduced.

K3VLS Series

Swash Plate Type Axial Piston Pump

Specifications
Size: 50, 65, 85, 105, 125, 150
Rated Pressure: 28 MPa
Peak Pressure: 35 MPa

General Descriptions
The K3VLS are variable displacement axial piston pumps of swash plate design, suitable for use in mobile applications and industrial vehicles with medium pressure hydraulic systems.

The K3VLS pumps enable flexible configuration in a wide range of applications with their compact size and light weight design.

The K3VLS series pumps are available in size (rated displacement) ranging from 50 to 150 cm³/rev with various control options, such as load sensing, pressure cut-off, and horsepower controls.

Features
- Variable axial piston pump of swash plate design in open circuits
- High overall efficiency
- Compact size
- Light weight
- Excellent reliability
- Numerous control options
- High stability
- Highly responsive controls

(Note) Maximum pressure must be reduced to operate within the allowable maximum input torque as below when the torque limit control is not used.

- SAE B spline K3VLS50: 24 MPa K3VLS65: 18 MPa
- SAE C spline K3VLS150: 25 MPa

For above options, if 28 MPa is needed, use the torque limit control.
2-2 Functional Description of Regulator

Load Sensing and Pressure Cut-off
(Ordering Code [9]: L0 / L1)

This regulator has function of flow and pressure control (i.e. load sensing control and pressure cut-off control.)

To control flow a variable orifice is used. (A variable orifice is not included in the pump and shall be prepared separately.) Pump displacement is controlled to maintain the differential pressure across the orifice constant. The flow is controlled to a required flow regardless of pump delivery pressure. In addition, there is a pressure cut-off function incorporated into the control. The pressure cut-off function overrides the flow control function.

L0 control: with a bleed off orifice
L1 control: without a bleed off orifice

Releasing the pressure at port PL results in standby condition, which provides zero flow at unloading condition. The unloading pressure is typically 0.1 to 0.2 MPa higher than differential pressure setting.

2. Technical Information

2-2 Functional Description of Regulator

กรมควบคุม
(Ordering Code [9]: P0)
This regulator has function of pressure control. As discharge pressure rises to the cut-off setting, the pump displacement is reduced to prevent the discharge pressure from exceeding and keep the set pressure. It is imperative that a safety relief valve be installed in the system. By connecting the Pc port to a remote pressure control relief valve, variable pump pressure control can be achieved. The remote pressure control relief valve is to be set to 1.5 MPa below to the required system pressure.

The remote control relief valve is out of scope of supply.

**Torque Limiter**

(Ordering Code [11]: A)

L0/L1 control functions as previously noted. In response to a rise in delivery pressure the swash plate angle is decreased, restricting the input torque. This regulator prevents excessive load against the prime mover.

The torque limiter is comprised of two springs that oppose the spool force generated by the system pressure. By turning the adjustment screws, the appropriate input torque limit can be set.

Torque limiter control setting is shown in the attached table, and the torque limiter can be adjusted by the torque value of the table. Refer to the instruction manual for adjustment.

2-2 Functional Description of Regulator

Torque Limiter with Power Shift
(Ordering Code [11]: B, C2*, C3*)

Torque limiter is available with variable torque limit control. Torque limit setting can be varied by the external pilot pressure supply (code "B") or the integrated electric proportional control valve with the external servo pressure supply (code "C"). Code "B" and "C" enable to shift the power control setting as shown in the following torque limiter control characteristic curve.

See the table (page 19) for torque setting according to the external pilot pressure or the input current to the integrated proportional valve. Required servo pressure to the solenoid is 3.5 to 4.5 MPa.

( *): Ordering code C2, C3 are under development.

Input torque in the above table is planned value and for reference.  
• Size 125 and 150 are under development.
2-2 Functional Description of Regulator

Electric Displacement Control (Positive Control)
- With Fail-safe Function (Ordering Code[11]: E2, E3)
- Without Fail-safe Function (Ordering Code[11]: F2, F3)

The electric displacement control enables the pump displacement to be changed according to the change of input current to the solenoid. The pump displacement can be adjusted in proportion to the input current between the input current of \(I_1\) and \(I_2\) (refer to control curve).

With fail-safe function, at loss of input current in such case of brakage of electric wires, the pump displacement becomes maximum automatically. Even under this condition the load sensing and pressure cut-off control can be operated.

The fail-safe function is designed only for usage in short period for emergency. Necessary repair is to be made in the soonest opportunity.

For the hydraulic circuit refer to page 21.

Note for pumps with fail-safe

Note for start up
Due to its structure, the electric displacement control requires larger input current than \(I_2\) at start up, then normal proportional control can be achieved between \(I_1\) and \(I_2\).

Minimum operating pressure
With fail-safe function, in order to ensure safety and repeatability of control the minimum operating pressure of 5 MPa is to be secured. This avoids switching the pump to fail-safe mode unexpectedly.

Input current ramp time requirement
With fail-safe function (Ordering code: E2, E3), ramp time of 200 msec or larger is to be secured.

The table below shows the recommended dither conditions for the input current:

<table>
<thead>
<tr>
<th>Ordering code</th>
<th>(I_1)</th>
<th>(I_2)</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2, F2</td>
<td>200</td>
<td>600</td>
</tr>
<tr>
<td>E3, F3</td>
<td>400</td>
<td>1,200</td>
</tr>
</tbody>
</table>

Recommended dither condition for the input current
- Dither frequency: 150 Hz
- Dither amplitude: for E2, F2 200 mA\(^{pp}\), for E3, F3 400 mA\(^{pp}\)

The following table shows the technical information for the pumps with fail-safe function:

3-2 Installation of Auxiliary Pumps

Allowable mass moment for combination pump

K3VLS series can consist of multiple pumps using through drive mounting. The second pump can be attached up to the same size of the first pump. The table below shows the maximum allowable mass moment to the mounting flange of the first pump under the dynamic acceleration of 10G. The moment can be calculated by the formula shown below.

<table>
<thead>
<tr>
<th>Allowable mass moment $T_m$ (Nm) (dynamic acceleration of 10G)</th>
<th>K3VLS50</th>
<th>K3VLS65</th>
<th>K3VLS85</th>
<th>K3VLS105</th>
<th>K3VLS 125+/150</th>

<td>330</td>
<td>280</td>
<td>410</td>
<td>280</td>
<td>410</td>
</tr>
</tbody>
</table>

* 1: Size 125 is under development.

Calculation formula for mass moment

$$T_m = \left( m_1 \times L_1 + m_2 \times L_2 + m_3 \times L_3 + \ldots \right) \times \frac{1}{102}$$

$m_1, m_2, m_3 \ldots$ : Weight of pump [kg]

$L_1, L_2, L_3 \ldots$ : Center of gravity [mm]

See next page for values.
